                                                                                                                                                                                                                                                       The invention relates to short interfering nucleic acids (siNA) which CC downregulate expression of the human G72 gene by RNA interference. The CC siNAs may or may not comprise ribonucleotides and may be double or single CC stranded. They further comprise sense and antisense regions, or CC alternatively are assembled from a sense oligonucleotide and an antisense CC oligonucleotide. Specifically, the siNAs include short interfering RNA CC (shRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA CC (shRNA). The siNAs can be unmodified or chemically modified, can contain CC (shRNA). The siNAs can be unmodified or chemically modified, can contain CC (shRNA) in vitro or in vivo delivery of siNA; conjugates and/or complexes CC for the in vitro or in vivo delivery of siNA; conjugates and/or complexes CC for siNA; and vectors that express siNA. The siNAs are used to modulate cof a variety of conditions. The human G72 siNAs have neuroleptic activity and can be used for treating schizophrenia. The siNAs are also useful for CC drug screening, diagnosis, therapeutic target identification and

The invention relates to short interfering nucleic acids (siNA) which CC downregulate expression of the human G72 gene by RNA interference. The CC siNAs may or may not comprise ribonucleotides and may be double or single CC stranded. They further comprise sense and antisense regions, or.

CC alternatively are assembled from a sense oligonucleotide and an antisense CC oligonucleotide. Specifically, the siNAs include short interfering RNA CC (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA CC (shRNA). The siNAs can be unmodified or chemically modified, can contain CC deoxyribonucleotides, and can be chemically mynthesised, expressed from a CC vector or enzymatically synthesised. The invention also relates to kits CC for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate CC expression of the G72 gene in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment CC drug screening, diagnosis, therapeutic target identification and cc validation, genetic engineering, pharmacogenomics, studying gene CC drug screening, diagnosis, therapeutic target identification and CC validation, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the upper strand of a human G72-targeted. CC double-stranded sina, which is identical to the G72 transcript target.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             20-FEB-2002;

The composition comprises DNA encoding interferon (IFN)-gamma and may be administered to the patient by intranasal gene transfer. It is useful for treating respiratory viral infections, especially respiratory syncytial virus (RSV). The composition of the invention may be administered to an infant or other immunosuppressed individuals

                                                                                                                                                       This is an II-5 mRNA target sequence (nucleotide no. 10) of an enzymatic RNA molecule (ribozyme) which cleaves mRNA associated with the development or maintenance of a psoriatic or asthmatic condition. The conc. of the ribozyme necessary to effect a therapeutic treatment is lower than that of an antisense oligonucleotide and the specificity of action is higher. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is the human interleukin-5 (hII-5) promoter mutant palindromic regulatory element (PREI-3), which inhibits the activity of the hII-5 promoter and therefore II-5 expression. PREI-3 can be used to modulate II-5 activity by acting on the corresponding region of the hII-5 promoter, especially in cases of asthma and eosinophilia or in immunocompromised subjects. PREI-3 specifically inhibits transcription from the II-5 promoter, as no such sequence is present in genes encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 21

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ននិនិត្តិនិនិន
The invention relates to an antisense compound of 8-30 nucleobases in clerity, which modulates interleukin (II)-5 signal transduction. Also include are a pharmaceutical composition comprising the antisense coligonucleotide and a pharmaceutically acceptable carrier or diluent, and a diagnostic kit for detecting the expression level of the membrane form versus soluble form of II-5 receptor. The antisense compound is useful for modulating II-5 signal transduction, modulating expression of mammalian II-5 or modulating the expression of mammalian II-5 receptor a, in cells or tissues, for altering the ratio of the isoforms of mammalian cells or tissues, treating a mammalian cells or tissues, treating a mammalian cells or tissues, treating a mammalian or having a disease or condition associated with II-5 signal transduction, II-5 expression or II-5 receptor a expression, where the disease or condition include eosinophilic syndrome or asthma. An antisense compound which alters splicing of an RNA encoding II-5 receptor a is also useful for treating a mammal having a disease or condition. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

The antisense oligonucleotides may be used for the treatment of diseases associated with IL-5 signal transduction, IL-5 expression or IL-5 receptor-alpha expression. Such diseases include asthma and eosinophilic syndrome. The oligonucleotides are also useful for research uses and to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel antisense compound for treating disease/condition e.g. eosinophilic syndrome or asthma associated with interleukin-5 or IL-5 receptor expression or IL-5 signal transduction, modulates IL-5 signal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              US2002128216-A1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ঠ
The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the cinitiation codon, coding region, 5' or a send genomic flanking regions, 5' or and genomic flanking regions, 5' or and all control coding region, 5' or a suthin 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or compassion of the invention and a second active agent comprising an cantiinflammatory steroid and ubiquinone. A composition of the invention cantiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a cuse in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also cor enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of antiinflammatory producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine of confiction inflammation, lung allergies, or a respiratory disease or condition. CC Note: The sequence data for this patent is not represented in the printed confiction, but was obtained in electronic format directly from WIPO

ACCOMPANA
AC This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for alleviating composition, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, considered in the producing adenosine sensitivity, levels of adenosine (A) or (A) receptors, considered in the constant depletion or hyposecretion, when administered to a mammal. The colligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung alivary or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to

The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Navl.3, where the antisense compound specifically hybridizes with and inhibits the expression of Navl.3. The compound and composition are useful for treating a disease or condition associated with Navl.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralpia, chronic pain, lower back pain, diabetic neuropathy, trigeninal neuropathy, arthritic pain, acute pain, abant from burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothioate oligonucleotide with

                          The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Navl.3, where the antisense compound specifically hybridizes with and inhibits the expression of Navl.3. The compound and composition are useful for treating a disease or condition associated with Navl.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache, seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothicate oligonucleotide with 2°MOS wings and a deoxy gap. Used during the antisense inhibition of human Navl.3 expression, the oligonucleotides are designed to target different regions of the human Navl.3 RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          2'MOE wings and a deoxy gap. Used during the antisense inhibition of human Navl.3 expression, the oligonucleotides are designed to target different regions of the human Navl.3 RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nav1.3; Analgesic; Nootropic; Neuroprotective; post-herpetic diabetic neuropathy; arthritic pain; migraine headache;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ADK79309
                                                                                                                                                                                                                                                                                Claim 4; SEQ ID NO 6643; 417pp; English
                                                                                                                                                                                                                                                                                                               New antisense compound targeted to a nucleic acid molecule encoding Nav1.3, useful for useful for treating a disease or condition associated with Nav1.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.

                                              The invention relates to an antisense compound that modulates interleukin CC 5 (IL-5) signal transduction. The antisense compound is an antisense CC oligonucleotide targeted to a nucleic acid molecule encoding a mammalian CC IL-5 or IL-5 receptor a, where the antisense compound modulates the CC expression of mammalian IL-5 or IL-5 receptor a. The antisense compound modulates the CC oligonucleotide comprises at least one modified internucleoside linkage, i.e. a 2'-0-methoxyethyl sugar moiety, i.e. a 2'-0-methoxyethyl sugar moiety, and at least one modified sugar moiety, i.e. a 2'-0-methoxyethyl sugar moiety, and at CC least one modified nucleobase, i.e. 5-methylytosine. Altering the ratio of the isoforms of mammalian IL-5 receptor a in mammalian cells or tissues comprises contacting the cells or tissues with an antisense compound so that the ratio of the mammalian IL-5 receptor a isoforms is CC disease or condition characterised by a reduction in apoptosis comprises administering to the mammal a therapeutic or prophylactic amount of an antisense compound so that IL-5 receptor a expression, or a creeptor a expression, or IL-5 receptor a expression, or IL-5 receptor a expression of IL-5 receptor a isoforms is altered, or expression of membrane IL-5 receptor a conditated. The antisense compounds, methods and compositions are CC is modulated. The antisense compounds, methods and compositions are CC oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     26-MAR-1999;

                                                                                                                                                        primer A800 and SATG (AAV32486) were used in the method of the invention to determine the prevelance of cDNA clones with a 114 bp deletion in the human retinaldehyde binding protein HRGR1-2 cDNA (AAV32476). The HRGR1-7 cDNA (AAV32477) of clone HRGR1-7, isolated from a human lambda-gt10 retinal library, was found to contain the deleted region which corresponded to the nucleotide sequence of exon 6 (AAV32483) of the human retinaldehyde binding protein gene. The human retinal and all-trans protein HRGR1-2 (AAW48858) binds both 11-cis-retinal and all-trans retinal. The invention claims that molecular aberration of the visual system can be detected in binding sassys by observing any changes in the binding of the retinaldehyde binding protein HRGR1-2 to its chromophores. The retinaldehyde binding protein hrgr1-2 can also be used to raise antibodies, which in turn can be used to detect changes of the protein in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human retinaldehyde binding protein HRGR1-2; retinal pigment epithelium; 11-cis-retinal; all-trans retinal; visual system; binding assay; chromophore; PCR; primer; amplification; ss.
                                                                                                                                                                                                                                                                                                                                                                                             Human and bovine retin-aldehyde-binding proteins - used to detect aberration(s) of retinal binding in visual excitation systems.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human retinaldehyde binding protein HRGR1-2 cDNA primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            11-SEP-1998

                                                                                                                                                                                                                                                                                                                                                                                                           AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX91990). C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAX94584 - AAX95879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope; PCR primer; ss.

Retinaldehyde binding protein is the first light-absorbing vertebrate protein identified to stably and preferentially bind the all-trans-retinal chromophore. Retinaldehyde binding proteins have distant homology to other G protein-coupled receptors, possessing seven transmembrane domains. The nucleic acid and encoded protein are useful for assaying changes in the structure or the retinaldehyde-binding proteins which would be indicative of a molecular aberration in the retinal pigment epithelium, visual system or brain. The nucleic acid is also useful in antisense therapeutics and in the recombinant expression of retinaldehyde-binding protein. Sequences ARZ55948-Z5584 represent probes or PCR primers used in exemplifications of the invention and in the retinaldehyde-binding protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the CC initiation codon, coding region, 5 or 3 end genomic flanking regions, CC 5 and 3 intron-exon junctions, or regions within 2-10 nucleotides of CC junctions of genes encoding a polypeptide associated with lung and/or CC nasal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention CC immunosuppressive, and cytostatic activity. The composition may have a CC use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also CC for enhancing the prophylactic or therapeutic respiratory effect of an CC antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine creceptor, producing bronchodilation, increasing levels of biquinone or CC lung surfactant in a subject's tissue, or treating bronchoconstriction, and supplication in a respiratory disease or condition. CC supplies and the prophylactic or the sequence or condition. CC supplies the prophylactic or the sequence or condition. CC supplies the prophylactic or the sequence or condition. CC supplies the prophylactic or the sequence or condition. CC supplies the prophylactic or the sequence or condition. CC supplies the prophylactic or the sequence or condition. CC supplies the prophylactic sequence or condition.

EPIGENESIS

```
comprising oligonucleotides, effective for alleviating composition of igonucleotides, effective for alleviating composition, respiratory tract inflammation, allergies and creducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, composition or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating composition of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery composition for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, composition for analysesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung complammation, allergies and/or bronchoconstriction and/or lung complammation, allergies and/or bronchoconstriction, respiratory hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary the reduced adenosine content of the anti-sense oligos corresponding to the oligonucleotides into products that free adenosine into the system content any unwanted effects due to it
